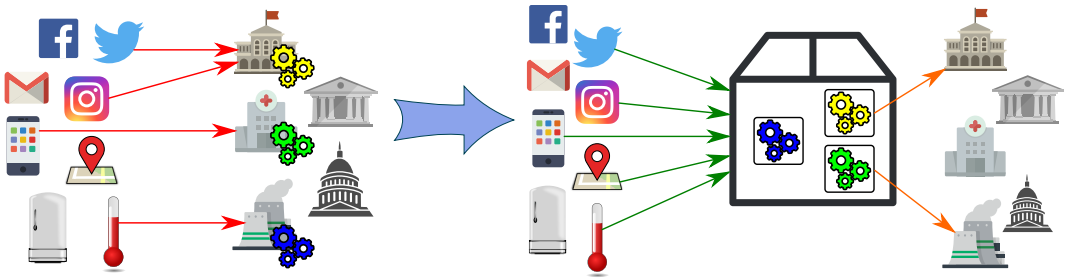
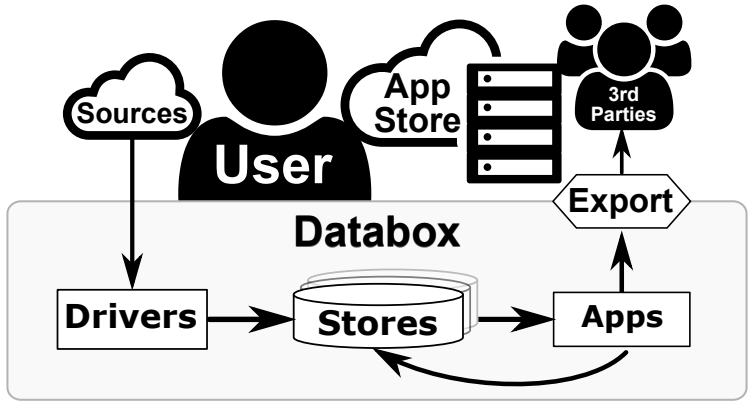
Research Context

The Databox Platform

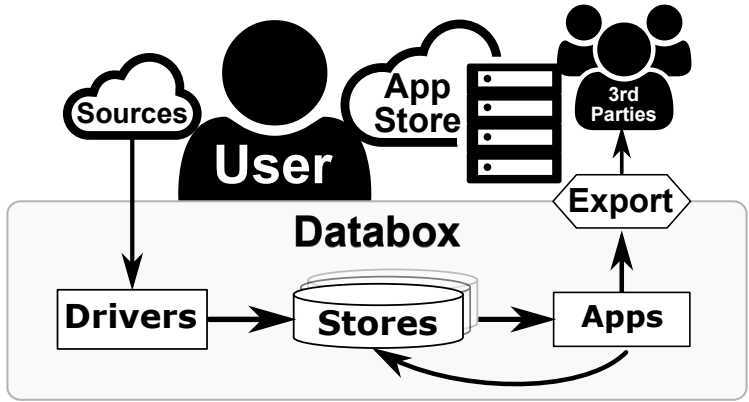


Research Context

The Databox Platform

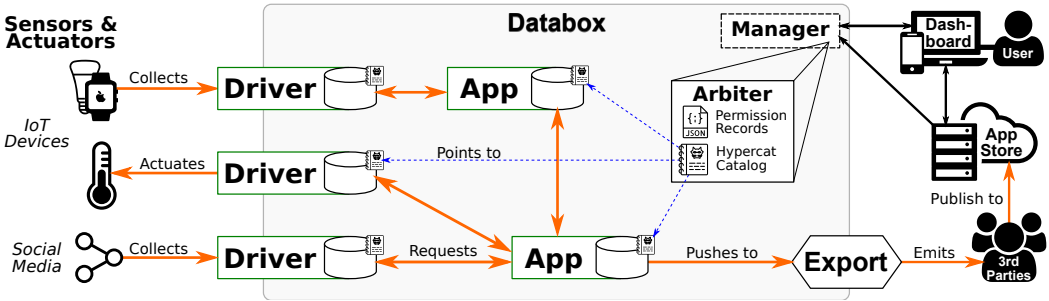


Research Context
The Databox Platform



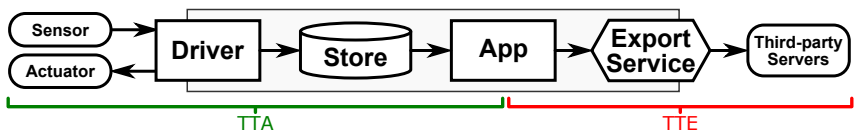
How can we design safe, scalable access control systems with arbitrary restrictions in this context?

Implementation



Evaluation

- Scalability
  - Resource usage (CPU, memory, network I/O)
  - Inserts/s over stores under maximum load
  - Store launch time with and without arbiter interaction (memory bottleneck)
- Topology
  - Device → Cloud
  - Device → Cloud → Home
  - Device → Home
  - Device → Home → Cloud
- Time to Availability – High-frequency mobile sensors



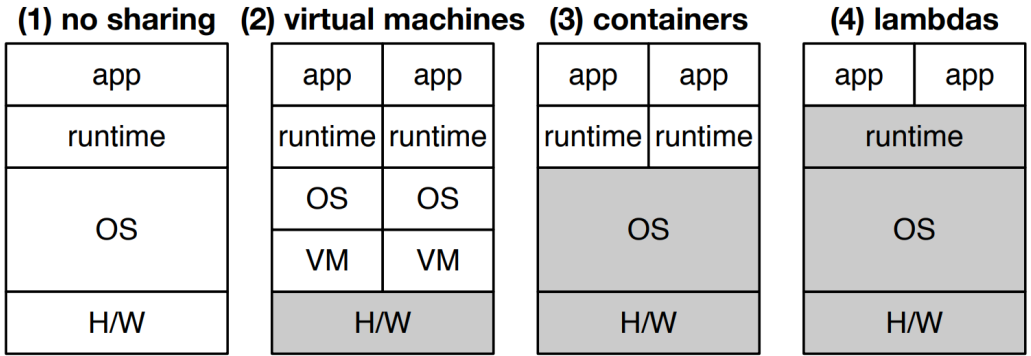


Figure 1: **Evolution of Sharing.** *Gray layers are shared.*

Figure: Hendrickson, et al. "Serverless computation with openlambda." Elastic 60 (2016): 80.

Implementation
Low-latency Serverless

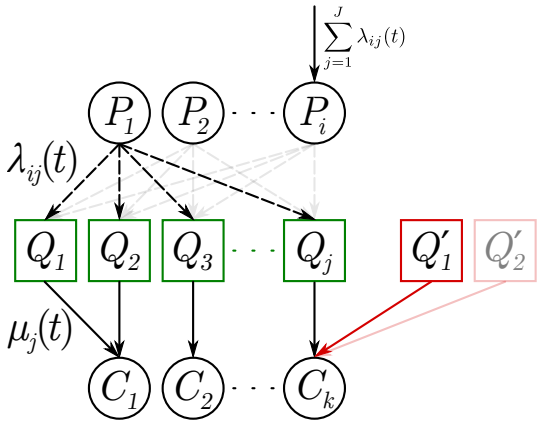

Figure: An Overview of Inter-component Relationships

Implementation
Low-latency Serverless

Plans
Privacy and Risk Metrics

- Measuring privacy risk is very subjective
- Information-theoretic, content-independent metrics are generalisable
- Looking just at metadata and schema of personal data, calculate objective metrics:
  - k-anonymity
  - l-diversity
  - t-closeness
- Thresholds can be embedded into tokens – privacy-aware access control for free (!)

Plans
Privacy and Risk Metrics

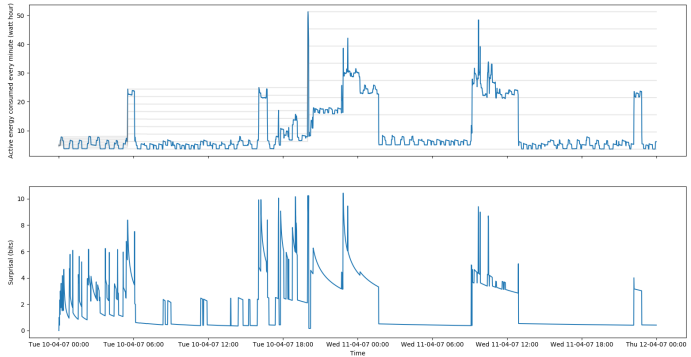

Figure: One Proof of Concept Experiment – Surprisal over Real Smart Meter Data

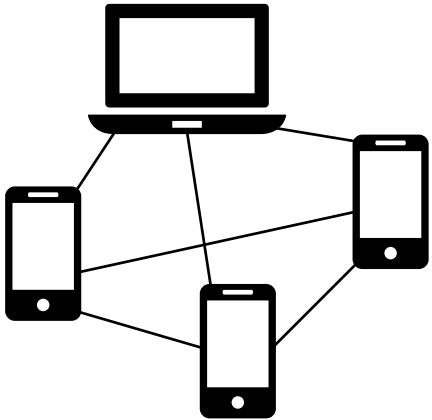
Plans

Serverless over Transient Clouds

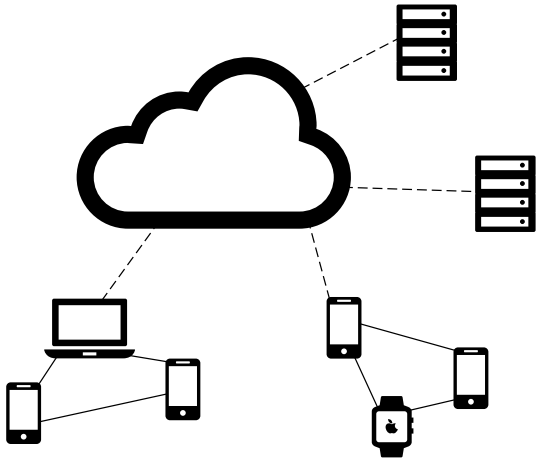
- Serverless on the edge
- Optimising for context through latency
- Processor selection based on arbitrary metrics, e.g. surprisal



Plans

Transient Privacy-Aware Clouds

- Encoding user-defined thresholds into bearer tokens
- Joint context at hierarchical levels
- TCACs $\rightarrow$ TPACs?



The Big Picture
